

LM2745-19A Demo Board

National Semiconductor
Application Note 1573
Ricardo Capetillo
May 2007

Introduction

This application notes describes the LM2745 printed circuit board (PCB) design and provides an example typical application circuit. The LM2745 is a voltage mode PWM buck controller which implements synchronous rectification. It provides a low cost, high power density, and efficient point of load solution. In steady state operation the LM2745 is always synchronous, even at no load, thus simplifying the compensation design. The LM2745 ensures a smooth and controlled start-up when the output is pre-biased. The current limit protection does not require a current limit resistor in the power path, but is achieved by sensing the voltage V_{DS} across the low side MOSFET. Though the control sections of the IC are rated for 3 to 6V (V_{CC}), the driver sections are designed to accept input supply rails (V_{IN}) as high as 14V.

Specifics Of The Board

This demo board targets the fixed and mobile telecommunications, industrial electronics, and distributed power markets. The demo board has a V_{IN} range of 8V to 14V and a LDO regulator, the LP2937, powers V_{CC} by regulating a 5V output voltage. The LM2745 regulates to an output range of 1.2V to 3.3V at 19A with a switching frequency of 300 kHz. Note, the demo board is optimized for the above parameters, thus for additional design modifications refer to the Design Consideration section of the LM2745 data sheet. The PCB is designed on four layers, the top and bottom layers are 2oz. copper and the two inner layers are 1oz. copper. The board measures 2.19 in. x 1.03 in. x 0.41 in. (56 mm x 26.2 mm x 10.3 mm) (l, w, h) on a FR4 laminate.

Feature Options

When the tracking feature of the LM2745 is required for use, remove the jumper that connects the soft-start capacitor C10 and connect the resistor divider, on designators R13 and R14, see Figure 1. The Track terminal has been provided for your connecting convenience. The demo board is synchronize ready, just connect an external clock to the SYNC terminal.

Note, increasing the switching frequency results in a lower inductor current ripple and input and output voltage ripple (if the component values are kept the same). Monitor the MOSFET junction temperature since switching losses will increase, and do not exceed the maximum junction temperature of the MOSFET. Refer to the MOSFET manufacturer datasheet for maximum junction temperature specification and heat sinking guidelines.

FIGURE 1. Soft-Start and Tracking Jumper

Specification Summary

- Space saving footprint
- Wide ambient temperature range: -40 °C to 65 °C
- Input voltage range: 8V to 14V
- Adjustable output voltage: 1.2V to 3.3V
- No minimum load requirement
- Remote ON/OFF
- Power good signal
- Fixed switching frequency: 300 kHz
- Switching frequency synchronize range 250 kHz to 1 MHz
- Current Limit Protection
- Master power supply start-up tracking function
- Start-up with a pre-biased output load
- Adjustable soft-start
- Small size 2.19 in. x 1.03 in. x 0.41 in. (56 mm x 26.2 mm x 10.3 mm)

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
