

LM3444 - 230VAC, 8W Isolated Flyback LED Driver

National Semiconductor
Application Note 2097
Clinton Jensen
April 5, 2011

Introduction

This demonstration board highlights the performance of a LM3444 based Flyback LED driver solution that can be used to power a single LED string consisting of 4 to 10 series connected LEDs from an 180 V_{RMS} to 265 V_{RMS}, 50 Hz input power supply. The key performance characteristics under typical operating conditions are summarized in this application note.

This is a four-layer board using the bottom and top layer for component placement. The demonstration board can be modified to adjust the LED forward current, the number of series connected LEDs that are driven and the switching frequency. Refer to the LM3444 datasheet for detailed instructions.

A bill of materials is included that describes the parts used on this demonstration board. A schematic and layout have also been included along with measured performance characteristics.

Key Features

- Line injection circuitry enables PFC values greater than 0.98
- Adjustable LED current and switching frequency
- Flicker free operation

Applications

- Solid State Lighting
- Industrial and Commercial Lighting
- Residential Lighting

Performance Specifications

Based on an LED $V_f = 3.6V$

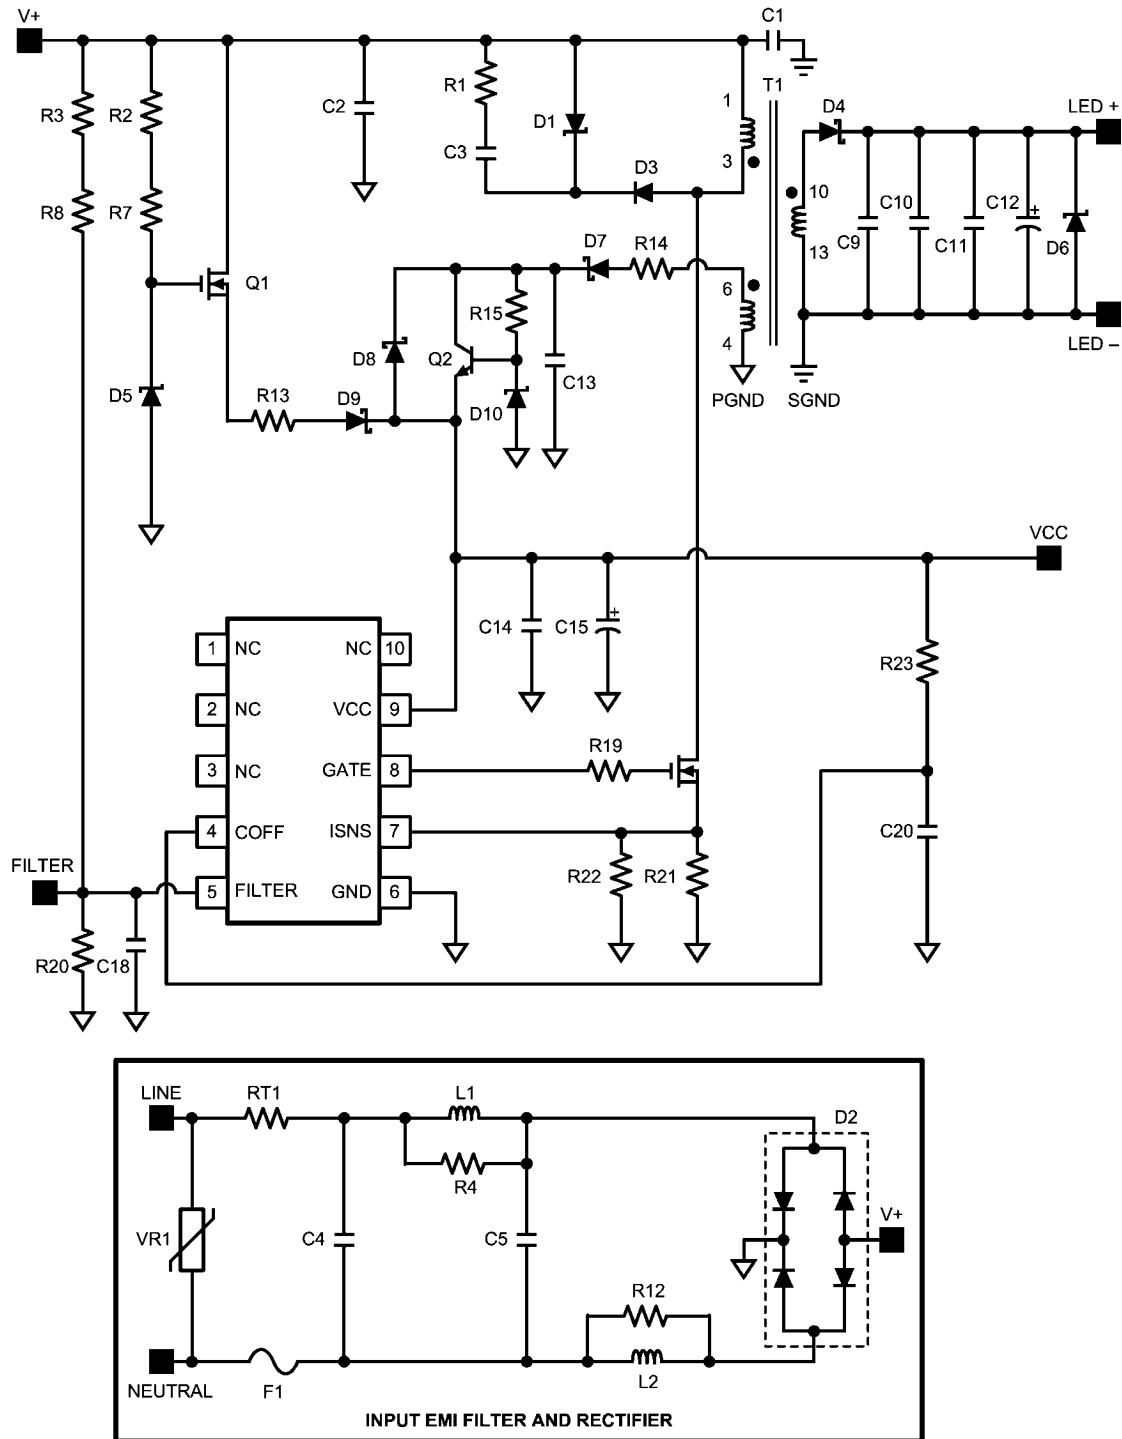

Symbol	Parameter	Min	Typ	Max
V_{IN}	Input voltage	180 V _{RMS}	230 V _{RMS}	265 V _{RMS}
V_{OUT}	LED string voltage	13 V	21.5 V	36 V
I_{LED}	LED string average current	-	350 mA	-
P_{OUT}	Output power	-	7.5 W	-
f_{sw}	Switching frequency	-	67 kHz	-

Demo Board

LM3444 230VAC, 8W Isolated Flyback LED Driver Demo Board Schematic

30139701

Warning: The LM3444 evaluation board has exposed high voltage components that present a shock hazard. Caution must be taken when handling the evaluation board. Avoid touching the evaluation board and removing any cables while the evaluation board is operating.

Warning: The ground connection on the evaluation board is NOT referenced to earth ground. If an oscilloscope ground lead is connected to the evaluation board ground test point for analysis and the mains AC power is applied (without any isolation), the fuse (F1) will fail open. For bench evaluation, either the input AC power source or the bench measurement equipment should be isolated from the earth ground connection. Isolating the evaluation board (using 1:1 line isolation transformer) rather than the oscilloscope is highly recommended.

Warning: The LM3444 evaluation board should not be powered with an open load. For proper operation, ensure that the desired number of LEDs are connected at the output before applying power to the evaluation board.

LM3444 Device Pin-Out

30139702

Pin Descriptions – 10 Pin MSOP

Pin #	Name	Description
1	NC	No internal connection.
2	NC	No internal connection.
3	NC	No internal connection.
4	COFF	OFF time setting pin. A user set current and capacitor connected from the output to this pin sets the constant OFF time of the switching controller.
5	FILTER	Filter input. A capacitor tied to this pin filters the error amplifier. Could also be used as an analog dimming input.
6	GND	Circuit ground connection.
7	ISNS	LED current sense pin. Connect a resistor from main switching MOSFET source, ISNS to GND to set the maximum LED current.
8	GATE	Power MOSFET driver pin. This output provides the gate drive for the power switching MOSFET of the buck controller.
9	V _{CC}	Input voltage pin. This pin provides the power for the internal control circuitry and gate driver.
10	NC	No internal connection.

Experimental Results

The LED driver is designed to accurately emulate an incandescent light bulb and therefore behave as an emulated resistor. The resistor value is determined based on the LED string configuration and the desired output power. The circuit then operates in open-loop, with a fixed duty cycle based on a constant on-time and constant off-time that is set by selecting appropriate circuit components.

PERFORMANCE

In steady state, the LED string voltage is measured to be 21.55 V and the average LED current is measured as 347.5

mA. The 100 Hz current ripple flowing through the LED string was measured to be 194 mA_{pk-pk} at full load. The magnitude of the ripple is a function of the value of energy storage capacitors connected across the output. The ripple current can be reduced by increasing the value of energy storage capacitor or by increasing the LED string voltage.

The LED driver switching frequency is measured to be close to the specified 67 kHz. The circuit operates with a constant duty cycle of 0.21 and consumes near 9W of input power. The driver steady state performance for an LED string consisting of 6 series LEDs is summarized in the following table.

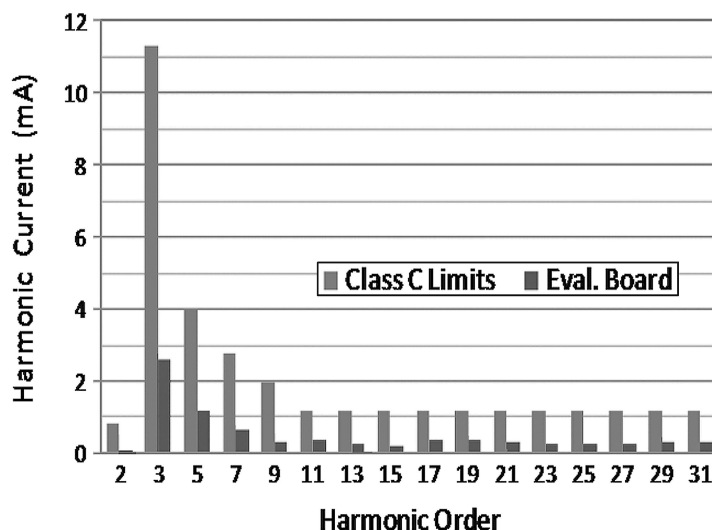

MEASURED EFFICIENCY AND LINE REGULATION (6 LEDs)

V_{IN} (V _{RMS})	I_{IN} (mA _{RMS})	P_{IN} (W)	V_{OUT} (V)	I_{LED} (mA)	P_{OUT} (W)	Efficiency (%)	Power Factor
180	30.65	5.42	20.59	219.40	4.52	83.3	0.9867
190	32.35	6.06	20.80	242.55	5.05	83.3	0.9869
200	34.21	6.75	21.00	267.37	5.62	83.2	0.9870
210	36.01	7.47	21.18	293.39	6.21	83.2	0.9871
220	37.74	8.20	21.37	320.18	6.84	83.3	0.9872
230	39.44	8.96	21.55	347.51	7.49	83.6	0.9873
240	41.22	9.76	21.72	375.52	8.15	83.6	0.9874
250	43.29	10.62	21.90	404.82	8.86	83.5	0.9875
260	45.06	11.57	22.07	436.75	9.64	83.3	0.9877

CURRENT THD

The LED driver is able to achieve close to unity power factor (PF ~ 0.98) which meets Energy Star requirements. This design also exhibits low current harmonics as a percentage of

the fundamental current (as shown in the following figure) and therefore meets the requirements of the IEC 61000-3-2 Class-3 standard.

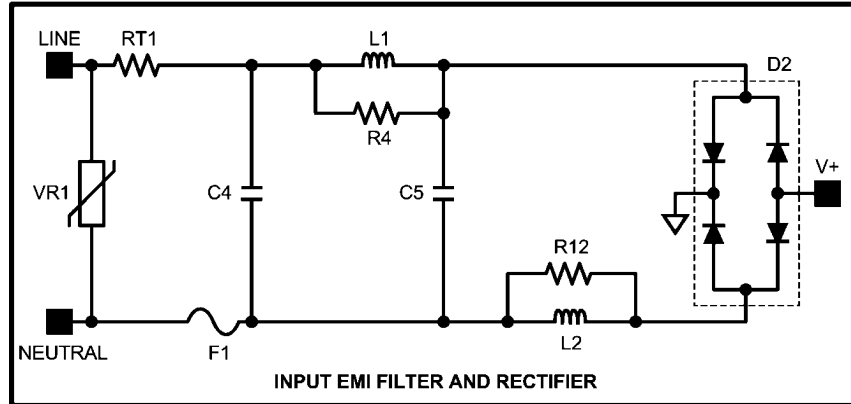

Current Harmonic vs. EN/IEC61000-3-2 Class C Limits

30139723

Electromagnetic Interference (EMI)

The EMI input filter of this evaluation board is configured as shown in the following circuit diagram.

30139731

FIGURE 1. Input EMI Filter and Rectifier Circuit

In order to get a quick estimate of the EMI filter performance, only the PEAK conductive EMI scan was measured and the

data was compared to the Class B conducted EMI limits published in FCC – 47, section 15.([Note 4](#))

30139732

FIGURE 2. Peak Conductive EMI scan per CISPR-22, Class B Limits

Note 4: CISPR 15 compliance pending

Thermal Analysis

The board temperature was measured using an IR camera (HIS-3000, Wahl) while running under the following conditions:

$$V_{IN} = 230 V_{RMS}$$

$$I_{LED} = 348 \text{ mA}$$

$$\# \text{ of LEDs} = 6$$

$$P_{OUT} = 7.2 \text{ W}$$

The results are shown in the following figures.

FIGURE 3. Top Side Thermal Scan

FIGURE 4. Bottom Side Thermal Scan

Circuit Analysis and Explanations

INJECTING LINE VOLTAGE INTO FILTER (ACHIEVING PFC > 0.98)

If a small portion (750mV to 1.00V) of line voltage is injected at FILTER of the LM3444, the circuit is essentially turned into a constant power flyback as shown in Figure 5.

FIGURE 5. Line Voltage Injection Circuit

The LM3444 works as a constant off-time controller normally, but by injecting the $1.0V_{PK}$ rectified AC voltage into the FIL-

TER pin, the on-time can be made to be constant. With a DCM Flyback, Δi needs to increase as the input voltage line increases. Therefore a constant on-time (since inductor L is constant) can be obtained.

By using the line voltage injection technique, the FILTER pin has the voltage wave shape shown in Figure 6 on it. Voltage at V_{FILTER} peak should be kept below 1.25V. At 1.25V current limit is tripped. C11 is small enough not to distort the AC signal but adds a little filtering.

Although the on-time is probably never truly constant, it can be observed in Figure 7 how (by adding the rectified voltage) the on-time is adjusted.

FIGURE 6. FILTER Waveform

For this evaluation board, the following resistor values are used:

$$R3 = R8 = 309 \text{ k}\Omega$$
$$R_{20} = 1.91 \text{ k}\Omega$$

Therefore the voltages observed on the FILTER pin will be as follows for listed input voltages:

For $V_{IN} = 180V_{RMS}$, $V_{FILTER_PK} = 0.78V$

For $V_{IN} = 230V_{RMS}$, $V_{FILTER_PK} = 1.00V$

For $V_{IN} = 265V_{RMS}$, $V_{FILT FB Pk} = 1.15V$

Using this technique, a power factor greater than 0.98 can be achieved without additional passive active power factor control (PFC) circuitry.

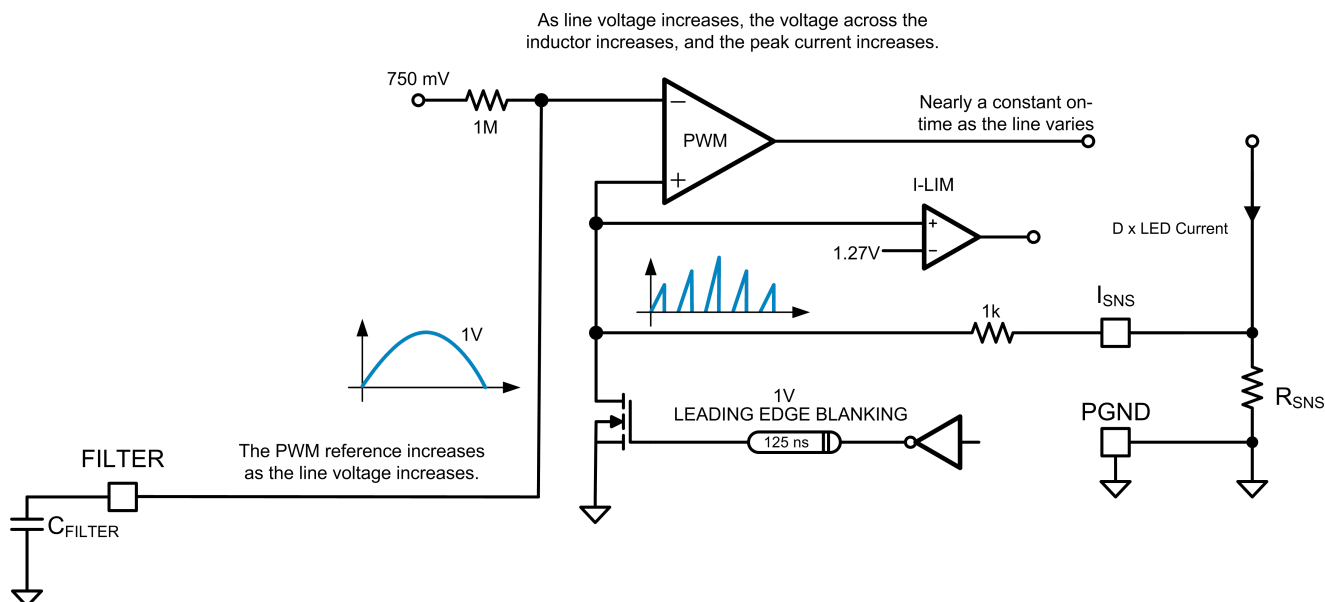

FIGURE 7. Typical Operation of FILTER Pin
